DOCUMENTED

OPS-002 is a reusable operational runbook with a defined scope.

OPS-002

SERVICE HEALTH CHECK RUNBOOK

Author: Jean Claude Munyakazi

Series: IT Operations Notes

Status: Portfolio operational document

Review cycle: After material infrastructure changes

Purpose

Validate service availability and isolate the failed dependency before recovery.

Target

Public HTTPS service delivered through Cloudflare Tunnel to an Apache origin server.

Evidence Standard

Record commands, observed output, timestamps, corrective action, and final validation.

The runbook separates symptoms from the failed service layer.

Availability

Can an external client resolve the name, connect, and receive the intended HTTP response?

Dependency

Which layer fails first: DNS, edge, tunnel, Apache, or the Linux server host?

Recovery

Apply only the action appropriate to the failed layer, then validate internally and externally.

CONTROL PRINCIPLE · Do not restart every component. Preserve evidence and recover the failed dependency.

Six layers provide a fast fault-isolation sequence.

The endpoint returns HTTP 200 within the defined timeout.

COMMAND

```
curl -sS -o /dev/null --max-time 15 \  
-w 'HTTP=%{http_code} DNS=%{time_namelookup}s  
CONNECT=%{time_connect}s TOTAL=%{time_total}s\n' \  
https://munyakazi.org
```

EXPECTED · HTTP 200 or intended redirect, completed within the timeout

```
root@pi:~# curl -sS -o /dev/null --max-time 15 \  
-w 'HTTP=%{http_code} DNS=%{time_namelookup}s CONNECT=%{time_connect}s TOTAL=%{time_total}s\n' \  
https://munyakazi.org  
HTTP=200 DNS=0.003521s CONNECT=0.050197s TOTAL=0.546903s  
root@pi:~#
```

OBSERVED · HTTP=200 · DNS=0.003521s · CONNECT=0.050197s · TOTAL=0.546903s

Name resolution must succeed before edge or origin troubleshooting.

COMMAND

```
dig +short munyakazi.org  
dig @1.1.1.1 +short munyakazi.org  
dig @8.8.8.8 +short munyakazi.org
```

EXPECTED · Public DNS resolvers return consistent A records for the Cloudflare-managed endpoint

```
root@pi:~# dig +short munyakazi.org  
dig @1.1.1.1 +short munyakazi.org  
dig @8.8.8.8 +short munyakazi.org  
172.67.163.2  
104.21.49.127  
104.21.49.127  
172.67.163.2  
104.21.49.127  
172.67.163.2  
root@pi:~#
```

OBSERVED · Public resolvers 1.1.1.1 and 8.8.8.8 consistently returned Cloudflare addresses 104.21.49.127 and 172.67.163.2.

The response code classifies where the investigation should move next.

HEADER CHECK

```
curl -sSI https://munyakazi.org  
curl -sS -D - -o /dev/null https://munyakazi.org
```

2xx / 3xx

Public path is available

403 / 429

Edge policy, WAF, access, or rate control

502 / 504

Tunnel or origin cannot complete the request

522 / 523

Origin reachability or network path problem

1033

Cloudflare Tunnel cannot find a healthy connector

cloudflared must be active, connected, and free of repeated origin errors.

COMMAND

```
systemctl is-active cloudflared
systemctl status cloudflared --no-pager
journalctl -u cloudflared --since '-15 minutes' --no-pager
```

FOCUSED LOG FILTER

```
journalctl -u cloudflared --since '-15 min' \  
| grep -Ei 'error|failed|timeout|origin'
```

EXPECTED · Active service with healthy connector sessions and no recurring origin failure

```
root@pi:~# sudo systemctl is-active cloudflared
sudo systemctl status cloudflared --no-pager
sudo journalctl -u cloudflared --since '-15 minutes' --no-pager
active
● cloudflared.service - cloudflared

Jun 12 12:32:29 pi cloudflared[823]: 2026-06-12T10:32:29Z ERR Request failed err...=http
Hint: Some lines were ellipsized, use -l to show in full.
-- No entries --
root@pi:~#
```

OBSERVED · was active and running. Temporary tunnel errors appeared in the logs, followed by successful reconnection and QUIC tunnel registration.

Service state and configuration syntax identify an origin-service failure.

COMMAND

```
systemctl status apache2 --no-pager  
apache2ctl configtest  
apache2ctl -S
```

EXPECTED · Apache active and enabled; configuration test returns Syntax OK.

```
root@pi:~# sudo systemctl is-active apache2  
sudo systemctl status apache2 --no-pager  
sudo apache2ctl configtest  
active  
● apache2.service - The Apache HTTP Server

                               └─ 148353 /usr/sbin/apache2 -k start  
  
Jun 10 06:53:39 pi systemd[1]: Starting apache2.service - The Apache HTTP Server...  
Jun 10 06:53:40 pi systemd[1]: Started apache2.service - The Apache HTTP Server.  
Syntax OK  
root@pi:~#
```

OBSERVED · Apache was active and running. The service was enabled, all worker processes were operational, and apache2ctl configtest returned Syntax OK.

A local request separates Apache health from tunnel and edge routing.

COMMAND

```
curl -I --max-time 10 http://127.0.0.1  
sudo ss -ltnp | grep -E ':(80|443)\b'
```

EXPECTED · Local origin returns the intended HTTP response or redirect, and Apache listens on ports 80 and 443.

```
root@pi:~# curl -I --max-time 10 http://127.0.0.1  
sudo ss -ltnp | grep -E ':(80|443)\b'  
HTTP/1.1 301 Moved Permanently  
Date: Fri, 12 Jun 2026 15:58:42 GMT  
Server: Apache/2.4.58 (Ubuntu)  
Vary: Accept-Encoding, Cookie  
Permissions-Policy: private-state-token-redemption=(self "https://www.google.com" "https://www.gstatic.com" "https://recaptcha.net" "https://challenges.cloudflare.com" "https://hcaptcha.com"), private-state-token-issuance=(self "https://www.google.com" "https://www.gstatic.com" "https://recaptcha.net" "https://challenges.cloudflare.com" "https://hcaptcha.com")

Location: https://munyakazi.org/  
Content-Type: text/html; charset=UTF-8  
  
LISTEN 0      511          *:443        *:~         users:(("apache2",pid=148353,fd=6),("apache2",pid=148346,fd=6),("apache2",pid=148345,fd=6),("apache2",pid=148338,fd=6),("apache2",pid=140090,fd=6),("apache2",pid=140089,fd=6),("apache2",pid=88370,fd=6),("apache2",pid=88365,fd=6),("apache2",pid=88360,fd=6),("apache2",pid=84605,fd=6),("apache2",pid=29531,fd=6))  
LISTEN 0      511          *:80         *:~         users:(("apache2",pid=148353,fd=4),("apache2",pid=148346,fd=4),("apache2",pid=148345,fd=4),("apache2",pid=148338,fd=4),("apache2",pid=140090,fd=4),("apache2",pid=140089,fd=4),("apache2",pid=88370,fd=4),("apache2",pid=88365,fd=4),("apache2",pid=88360,fd=4),("apache2",pid=84605,fd=4),("apache2",pid=29531,fd=4))  
root@pi:~# █
```

OBSERVED · The local origin returned HTTP 301 Moved Permanently and redirected to <https://munyakazi.org/>. Apache was listening successfully on TCP ports 80 and 443

Resource and operating-system evidence reveal capacity or host-level causes.

HOST HEALTH COMMAND SET

```
uptime  
free -h  
df -h  
df -i  
systemctl --failed  
dmesg -T | tail -n 50
```

LOAD	uptime / top	No sustained saturation
MEMORY	free -h	Available memory and swap
DISK	df -h	Sufficient free capacity
INODES	df -i	No inode exhaustion
UNITS	systemctl --failed	No relevant failed service
KERNEL	dmesg -T tail	No storage or OOM event

Correct only the failed layer and preserve the evidence trail.

DNS

Correct the record or zone configuration

EDGE

Review policy, WAF, access, or certificate state

TUNNEL

Restart cloudflared only after capturing logs

APACHE

Fix syntax or content, then graceful reload

HOST

Recover capacity, failed units, or operating-system resources

Recovery is complete only when internal and external checks both pass.

COMMAND

```
curl -sSI http://127.0.0.1  
curl -sSI https://munyakazi.org  
systemctl is-active apache2 cloudflared
```

Internal Gate

The local origin returns the intended response without tunnel or edge dependency.

External Gate

Public DNS, Cloudflare edge, tunnel, and origin complete the request path.

Operational Gate

Services remain active, logs remain stable, and the incident record captures the result.

Severity and incident records turn a health check into a repeatable process.

P1 · Critical

Public service unavailable; broad impact; immediate response and communication.

P2 · Major

Degraded or intermittent service; material user impact; prioritized remediation.

P3 · Minor

Limited impact or preventive finding; schedule correction and monitor.

Minimum Incident Record

- Date and detection time
- User-visible symptom
- Failed validation layer
- Commands and observed output
- Corrective action
- Internal and external validation
- Closure time and follow-up

Evidence makes the result auditable and suitable for handover.

From symptom to evidence, fault isolation, and controlled recovery.

01

VALIDATE

Check the request path in dependency order.

02

ISOLATE

Stop at the first failed layer and capture evidence.

03

RECOVER

Apply the targeted corrective action.

04

PROVE

Revalidate internally and externally, then document.
